New **PREMARK**[®] Primer

More than just a new look!

New container

The new **PREMARK**[®] primer is packed in a round, dent resistant can. On the top, the container is equipped with a carrying handle and a practical pouring spout. An informative label, safety data and instructions for usage are printed on the side. A standard container of the new **PREMARK**[®] primer contains 4 litres but is also available in a 20 litre container.

Improved adherence

The new **PREMARK**[®] primer is based on the same binding agent as **PREMARK**[®] and is thus 100% compatible with all **PREMARK**[®] material. Hence, the primer will ensure optimal adherence between **PREMARK**[®] markings and non-bitumen surfaces such as concrete, bricks, granite kerbs, cobblestones and old asphalt.

Increased transport protection

As an extra protection against leakage, the primer container is wrapped in a sealed plastic bag. The new **PREMARK**[®] primer is furthermore transported in a practical outer case that has been drop tested for durability up to 2 meters. The outer case will contain either one or four x 4 litre cans.

Clean surface and remove any moisture with propane burner

Apply **PREMARK**[®] primer in a thin layer

Allow approx. 20 min. for the primer to dry completely

Position **PREMARK**[®] material on top of primer and begin normal heating process
